TalentConnect

Background

Bill Sacks runs a small, independent acting agency. He's grown a large list of both industry contacts and actors he represents, but has been keeping all his contacts in a rolodex. He wants a basic app to better manage his contacts.

Project

Create a contact list using **Ember** and **Ember-Data** that does basic create, read, update, and delete functions. Required fields include:

+ First name

+ Last name

+ Phone number

+ Email

Any additional fields are also welcome, but are not required.

Additional Requirements

+ Contacts can be stored in Ember-Data, Firebase, a spreadsheet, etc. Use whatever you are comfortable with. Data does not need to persist between sessions for this project.

+ Customize the contact list as much as you want but it should at minimum display the contacts, show a specific contact, allow for deleting/editing a contact, and create a new contact.

+ Write at least one integration, acceptance, or unit test.

+ Use git and push repo to GitHub

MVP

Contact List

- Show contact list at index
- List all contacts by name
- New contact can be added

Contact

- Shows contact details
- Contact can be edited
- Contact can be deleted
